### **Title: Implementing Wall-Following Behavior for TurtleBot3 with ROS and Python**

#### Table of Contents:

1. Introduction
2. Requirements
3. Implementation Steps
  - Step 1: Initialize ROS Core
  - Step 2: Set TurtleBot3 Model
  - Step 3: Launch TurtleBot3 in Gazebo
  - Step 4: Navigate to Workspace
  - Step 5: Source Setup Script
  - Step 6: Run Wall-Follower Node
4. Wall-Follower Python Code Explanation
5. Conclusion

---

## 1. Introduction:

This document provides a step-by-step guide on implementing a wall-following behavior for a TurtleBot3 robot using ROS (Robot Operating System) and Python. The wall-following algorithm utilizes laser scan data to detect obstacles and adjust the robot's velocity and angular velocity accordingly.

## 2. Requirements:

- ROS (Robot Operating System)
- TurtleBot3 Simulation Environment
- Python 3.x
- `geometry\_msgs` and `sensor\_msgs` ROS packages

## 3. Implementation Steps:

### Step 1: Initialize ROS Core

```
``bash
$ roscore
``
```

### Step 2: Set TurtleBot3 Model

```
``bash
$ export TURTLEBOT3_MODEL=burger
``
```

### Step 3: Launch TurtleBot3 in Gazebo

```
```bash  
  
$ roslaunch turtlebot3_gazebo turtlebot3_stage1.launch  
  
```
```

#### Step 4: Navigate to Workspace

```
```bash  
  
$ cd mobile_robotics  
  
```
```

#### Step 5: Source Setup Script

```
```bash  
  
$ source devel/setup.sh  
  
```
```

#### Step 6: Run Wall-Follower Node

```
```bash  
  
$ rosrun wall_follower wall_follower.py  
  
```
```

#### 4. Wall-Follower Python Code Explanation:

-The provided Python script ``wall_follower.py`` implements the wall-following behavior. Here's a breakdown of its key components:

- PID Controller Parameters: Defines the proportional, integral, and derivative constants for the PID controller.
- Wall-Following Parameters: Sets the threshold for detecting obstacles, and the robot's move and rotation speeds.
- Laser Callback Function: Handles laser scan data, calculates errors, and adjusts the robot's velocity and angular velocity.
- ROS Initialization: Initializes the ROS node, publisher, and subscriber.
- ROS Loop: Continuously runs the wall-follower algorithm.

## 5. Conclusion:

By following the steps outlined in this document and understanding the provided Python code, you can successfully implement a wall-following behavior for a TurtleBot3 robot using ROS and Python.
